## Abstracts

The global High-Purity Lithium Foil market size is predicted to grow from US\$ 1896 million in 2025 to US\$ 6323 million in 2032; it is expected to grow at a CAGR of 18.9% from 2026 to 2032.

High-Purity Lithium Foil is an ultra-thin metallic lithium sheet (typically 99.9% purity) manufactured through vacuum refining, molten lithium extrusion, and precision rolling processes, primarily used as anode material in lithium metal batteries (LMBs), solid-state batteries (SSBs), and advanced primary lithium cells. The supply chain begins upstream with lithium brine or spodumene mining, processed into battery-grade lithium carbonate or lithium hydroxide, followed by molten salt electrolysis to produce lithium metal ingots. These ingots are then purified, cast, and rolled under inert atmosphere into micrometer-scale foil, slit, surface-treated, and packaged in moisture-free environments. Midstream players specialize in lithium metal refining and foil rolling, while downstream integration occurs in lithium metal battery manufacturers, solid-state battery developers, aerospace-grade primary cell producers, and high-energy-density EV platforms. Due to lithium's high reactivity, the industry requires strict dry-room processing, argon-protected handling, and specialized packaging logistics, making High-Purity Lithium Foil a high-value, safety-critical material positioned at the core of next-generation high-energy-density battery architectures. In 2025, global High-Purity Lithium Foil output was about 11,000 tons, versus 18,000 tons of capacity, with prices at USD 140,000–220,000 per ton and gross margins near 32%.

United States market for High-Purity Lithium Foil is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
