The global High-purity Oxygen-Free Copper market size is predicted to grow from US\$ 10671 million in 2025 to US\$ 18237 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

High-purity Oxygen-Free Copper is a high-cleanliness copper material manufactured using high-purity electrolytic copper cathodes as raw material through smelting, casting, hot working and precision cold working in a strictly oxygen-free, low-hydrogen and low-impurity volatilization environment. With a copper purity of no less than 99.99%, it is not absolutely free of oxygen, but controls both oxygen content and total impurities to an extremely low level. This endows it with ultra-high electrical and thermal conductivity, excellent vacuum stability and resistance to hydrogen embrittlement, effectively preventing defects such as porosity and cracking during high-temperature brazing and in hydrogen environments. It is divided into several mainstream purity grades, including 4N (99.99%), 4N5 (99.995%), 5N (99.999%) and 5N5 (99.9995%). Product forms cover ingots, bars, rods, strips, plates, wires, tubes and profiled materials, which present a uniform reddish-copper metallic luster, with a dense and clean internal structure and minimal non-metallic inclusions and surface defects. This material is mainly used in fields demanding high reliability and purity, such as vacuum electronic devices, semiconductor heat sinks and lead frames, superconducting and cryogenic equipment, accelerator components, high-end vacuum medical devices, high-frequency special cables, precision connectors and high-current components for new energy vehicles. In 2025, the global sales volume of High-purity Oxygen-Free Copper reached approximately 888,300 tons, and product prices varied significantly depending on purity grade, product form and purchase volume. Among them, the average market price of industrially bulk-marketed 4N high-purity oxygen-free copper rods was about 9,475 USD per ton, with an average industry gross margin of approximately 25%.
