In the context of physical vapor deposition (PVD) or sputtering techniques, a target is a solid material source from which atoms or molecules are ejected and deposited onto a substrate to form a thin film. High purity precious metals targets are utilized when extremely pure thin films of metals like gold, silver, platinum, or palladium are required for specific applications. These targets are manufactured to meet stringent purity standards, often reaching levels of 99.99% or higher purity to ensure the quality and performance of the deposited thin films. High purity precious metals targets are commonly used in the production of electronic devices, optical coatings, semiconductor components, and other advanced technologies where precise material properties are critical. Manufacturers of such targets employ advanced refining and purification processes to achieve the desired purity levels, ensuring that the resulting thin films exhibit optimal electrical, optical, or mechanical properties for their intended applications. There are eight metals that are considered precious. They are gold, silver, platinum, palladium, rhodium, ruthenium, iridium, and osmium and precious metals targets made from these metals.

The global High Purity Precious Metals Target market size is projected to grow from US\$ 270 million in 2024 to US\$ 358 million in 2030; it is expected to grow at a CAGR of 4.8% from 2024 to 2030.
