High purity monocrystalline silicon is an important semiconductor material. A p-type silicon semiconductor is formed by adding a small amount of the IIIa group element into the monocrystalline silicon. The N-type semiconductor is formed by adding a small amount of VA group elements. P-type semiconductors and N-type semiconductors are combined to form a P-N junction, which can be made into solar cells that convert radiant energy into electricity. It is a promising material for energy development. Another widely used diode, transistor, thyristor, field effect tube and various integrated circuits (including the chips and CPUs in people's computers) are made of silicon as the raw material.
