The global High Resolution Scanning Tunneling Microscopes market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Scanning tunneling microscopy is a type of scanning probe microscopy. Based on the detection of the magnitude of the tunneling current between the probe and the surface, fluctuations at the single-atom level on the surface can be observed. In addition, scanning tunneling microscopy can use probe tips to precisely manipulate individual molecules or atoms at low temperatures, so it is not only an important micro-nano scale measurement tool, but also a potential micro-nano processing tool. It is an instrument that uses the quantum tunneling effect to detect the surface structure of matter.

United States market for High Resolution Scanning Tunneling Microscopes is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
