High resolution transmission electron microscope is an imaging mode of special transmission electron microscope, which can directly image the atomic structure of samples. It is a powerful tool to study the properties of materials on the atomic scale, such as semiconductors, metals, nanoparticles and so on. The contrast of high-resolution transmission electron microscope image comes from the interference between the electron wave image plane and itself. It only has high resolution, so it can do what can be done by general transmission electron microscope, but the pole shoe spacing of objective lens of high-resolution electron microscope is relatively small, so the angle of double tilt table is smaller than that of analytical electron microscope.
