A High Shear Wet Granulation Machine is a type of equipment used in the pharmaceutical, food, and chemical industries for the production of wet granules. It operates by applying high shear forces to a liquid mixture containing active ingredients, excipients, and binders. The machine typically consists of a mixing chamber with a rotating impeller or agitator that generates intense shear and turbulent flow, promoting the formation of granules by aggregating the solid particles into larger, uniform clusters. The wet granules produced by this process are then further processed, such as drying, to obtain the final dosage form, such as tablets or capsules. The high shear wet granulation technique is advantageous for improving product quality, enhancing flow properties, and facilitating downstream processing.

The global High Shear Wet Granulation Machine market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
