Abstracts

The global High Shrinkage Acrylic Fiber market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Fibers with a boiling water shrinkage rate of 35% to 45% are referred to as high shrinkage fibers. The commonly used preparation method is to perform multiple hot stretching at a temperature higher than the glass transition point of acrylic fiber, to stretch the macromolecular chains in the fiber and orient them along the fiber axis, and then quench to temporarily fix the morphology and tension of the macromolecular chains in the fiber. In a relaxed state, wet heat treatment is applied to the yarn, where the macromolecular chains shrink due to thermal motion, causing significant shrinkage of the fibers in the length direction.

(2) Increasing the content of the second monomer methyl acrylate can significantly increase the shrinkage rate of acrylic fibers;

(3) The use of thermoplastic second monomers for copolymerization with acrylonitrile can significantly increase the shrinkage of the fibers. High shrinkage polyester fibers are generally obtained by modifying crystalline polyester.
