A high-side switch is a semiconductor device that turns the power supply on and off for loads such as motors, solenoids, inductors, and LEDs.

In most cases, P-channel MOSFETs are used as semiconductors. In the circuit wiring, the switch is placed on the power supply side of the load, so it is called a high-side switch.

When the high-side switch is ON, power is supplied to the load, and when the high-side switch is OFF, power is not supplied to the load. When the switch is placed on the output side of the load (opposite side of the power supply) in the circuit wiring, it is called a low-side switch.
