## Abstracts

The global High-Speed Countercurrent Chromatography market size is predicted to grow from US$ 49.7 million in 2025 to US$ 71.31 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

In 2024, the global production of High-Speed Countercurrent Chromatography instruments was approximately 1,500 units, with an average selling price of about US$32,200 per unit. Single-line capacity was approximately 150 units per year, with an average gross profit margin of about 35%.High-Speed Countercurrent Chromatography is a chromatographic technique that utilizes the principle of liquid-liquid two-phase countercurrent distribution for substance separation. It does not require a solid carrier; instead, it relies on centrifugal force to retain the stationary phase liquid in a high-speed rotating spiral tube, using another liquid as the mobile phase, thereby separating the mixture. Compared to traditional chromatography, it avoids sample contamination and adsorption by solid carriers, offering advantages such as high efficiency, speed, large injection volume, high recovery rate, and no sample loss.

Upstream core raw materials mainly include special stainless steel pipes, high-precision infusion pumps, various corrosion-resistant valves and connectors, high-purity sealing materials, optical detection modules, and motors and automatic control components. Downstream applications are highly concentrated in high-value-added industries such as natural product purification, innovative drug development, food quality and safety testing, environmental sample analysis, and protein and nucleic acid separation in life science research.
