The report requires updating with new data and is sent in 48 hours after order is placed.

The increase in data volume puts forward a demand for faster server interfaces, because large amounts of data need to be moved within and between servers. Data movement within the server may be the main bottleneck and the source of delay. By minimizing data movement and providing a high-bandwidth, low-latency interface when data needs to move, this is essential for maximizing performance, reducing latency and power consumption. As data rates increase, interface power consumption (usually measured in 'picojoules/bit') and area become more and more important. The physical interface (PHY) IP has obvious advantages to minimize energy consumption while reliably providing data within the required distance, thereby minimizing the power consumption and cooling costs of the infrastructure.
