A high-speed lock-in camera is a camera specially designed for high-speed signal detection and measurement. It combines high-speed image acquisition and phase-locking technology to capture and analyze high-frequency, weak-signal images in real time. High-speed lock-in cameras usually have the following characteristics: 1. High frame rate: capable of image acquisition at a very high speed, usually in the range of hundreds to thousands of frames per second. 2. High sensitivity: It can detect weak signals with high sensitivity to capture low light intensity or rapidly changing signals. 3. High resolution: high pixel count and image quality to provide clear image details and accurate measurement results. 4. Phase-locking function: With phase-locking

technology, it can extract and analyze signals of specific frequencies, so as to realize the measurement and analysis of specific signals. High-speed lock-in cameras are widely used in scientific research, optical microscopy, infrared imaging, spectral analysis, biomedical imaging, material characterization and other fields. They can capture and analyze details and changes in high-speed dynamic processes in real time, providing researchers with important data and information.
