High Speed Traction Lifts employ a traction system which consists of a motor, sheaves, and steel ropes or belts that move the elevator car. The motor drives the sheaves, which in turn move the ropes or belts, allowing the elevator car to ascend or descend within the shaft. This system enables faster and more efficient vertical transportation. The speed of high-speed traction elevators usually ranges from 500 to 2000 feet per minute (2.5 to 10 meters per second). This enables them to swiftly traverse large distances, reducing travel time and improving overall efficiency. To ensure passenger safety, high-speed traction elevators are equipped with advanced safety features and devices. These include overspeed governors, emergency brakes, door interlocks, and safety circuits that monitor and control the elevator's operation. Additionally, regular maintenance and inspections are essential to assess the equipment's condition and ensure compliance with safety regulations.
