The global High-Strength Getter market size is predicted to grow from US$ 78.9 million in 2025 to US$ 117 million in 2032; it is expected to grow at a CAGR of 5.9% from 2026 to 2032.

In 2024, the global production of high-strength getters will reach 30k units, with an average selling price of US$2500 per unit.High-strength getters are a class of functional materials with high specific surface area and high chemical activity. They are primarily used to continuously adsorb and remove gas molecules in closed or vacuum environments to maintain the system's high vacuum and atmosphere purity. Compared to conventional getters, high-strength getters offer superior gas adsorption capacity, reaction rate, and high-temperature resistance. Typically composed of metals such as zirconium, titanium, barium, and their alloys, they efficiently capture residual gases such as hydrogen, oxygen, nitrogen, carbon monoxide, and carbon dioxide through a dual mechanism of physical adsorption and chemical reaction. These materials are widely used in vacuum electronic devices (such as vacuum tubes, picture tubes, and microwave devices), spacecraft propulsion systems, the nuclear industry, and high-energy physics experimental equipment, ensuring the system maintains stable ultra-high vacuum and high reliability during long-term operation.

The upstream raw materials for high-strength getters primarily include high-purity metals and their alloy powders, such as zirconium, titanium, and barium. Some also require additives such as nickel and vanadium. Suppliers include international metal materials companies such as ATI Metals, TIMET, Alcoa, Hitachi Metals, and Nippon Steel, ensuring high purity and a stable supply. Downstream, these getters are widely used in aerospace, the nuclear industry, vacuum electronics, and scientific research equipment. Representative users include ESA, GE, Thales, and Siemens, relying on their stable performance in ultra-high vacuum and long-term operation.
