Abstracts

The global High-Temperature Ceramic Adhesive market size is predicted to grow from US$ 501 million in 2025 to US$ 863 million in 2032; it is expected to grow at a CAGR of 7.5% from 2026 to 2032.

High-Temperature Ceramic Adhesive refers to an inorganic adhesive formulated with ceramic or refractory fillers and a silicate, phosphate, colloidal-silica or other inorganic binder system.

It is used to bond, seal, pot, encapsulate or repair ceramics, metals, glass, quartz, graphite and refractory materials under elevated-temperature conditions. Commercial products are generally supplied as ready-mixed pastes, powders mixed with water or activating liquid, or two-component inorganic systems.

The 2025 benchmark ASP is US$18,000 per ton, modeled global sales volume is approximately 28.453k tons, and the estimated average gross margin is approximately 36%.

The upstream industry chain includes alumina, aluminosilicate, zirconia, zircon, silica, magnesia, boron nitride, aluminum nitride, silicon carbide, inorganic silicates, phosphates, colloidal silica, dispersants and packaging materials. The midstream includes powder purification, particle-size control, formulation, dispersion, mixing, filling, curing verification, thermal-cycle testing, dielectric testing and packaging. The downstream mainly covers aerospace, semiconductor equipment, electrical heating, industrial furnaces, automotive systems, energy equipment, chemical processing and research instruments.

High-temperature ceramic adhesives are selected when conventional organic adhesives cannot retain sufficient structural, dielectric or sealing performance at the required operating temperature. Inorganic systems form a ceramic-like bond after drying or heat curing and can remain functional at temperatures ranging from several hundred degrees Celsius to above 1,500°C, depending on the formulation and atmosphere. Aremco and Sauereisen both provide multiple inorganic cement formulations for bonding ceramics, metals, glass and refractory materials at elevated temperatures.

Maximum temperature is not the only selection criterion. The coefficient of thermal expansion of the cured adhesive should be reasonably compatible with the bonded substrates. A mismatch between ceramic, glass and metal components can create high interfacial stress during heating and cooling, resulting in cracking, debonding or substrate fracture.
