High Temperature Creep Testing Machine is a device used to test the creep characteristics of materials under high temperature conditions. Creep is the elongational

deformation of a material over time under constant stress. High-temperature creep testing is commonly used to evaluate the performance and reliability of materials in high-temperature, high-stress environments. High temperature creep testing machines usually have the following characteristics:

1. High temperature control capability: able to provide a stable high temperature environment, usually ranging from hundreds of degrees Celsius to thousands of degrees Celsius.
2. Load and Strain Measurement: Ability to apply a fixed load and measure the strain or deformation of the sample to monitor creep deformation.
3. Automatic control: Load application, temperature control and data acquisition are realized through electronic or computer control system to ensure accurate and repeatable tests.
4. Multi-channel data acquisition: capable of simultaneously collecting and recording data from multiple sensors, such as load, temperature, displacement, etc.
5. Safety measures: equipped with safety protection equipment, such as overload protection, temperature protection, etc., to ensure the safety of test operators and equipment.
