The global High-Temperature Heat Pump Steam Solution market size is predicted to grow from US\$ 852 million in 2025 to US\$ 1221 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

High-temperature heat pump steam solutions refer to a complete energy-saving heating system driven by electricity, based on the reverse Carnot cycle, that absorbs heat from air, groundwater, or low-grade industrial waste heat, raises the heat energy grade to above 100°C after work by a high-temperature compressor, heats feedwater through a condenser, and produces low- to medium-pressure industrial saturated steam under the action of a flash evaporator/steam compressor. This system is used to replace or partially replace gas/coal/electric boilers to provide process steam for industrial production, achieving an energy efficiency level of COP 1.5 to 3.0 or higher and near-zero on-site carbon emissions.
