## Abstracts

The global High Temperature Lubricating Oil market size is predicted to grow from US\$ 4402 million in 2025 to US\$ 6249 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

High-temperature lubricating oil is a specialized lubricating oil designed for extreme thermal environments. They are typically made from synthetic base oils (such as polyalphaolefins, synthetic esters, perfluoropolyethers, or silicone oils) combined with high-temperature resistant and antioxidant additives, maintaining chemical stability and lubrication performance at extremely high temperatures. Their core function is to form a durable lubricating film under high-temperature conditions, reducing friction and wear. They also possess excellent antioxidant, anti-coking, and anti-corrosion capabilities, primarily addressing the problems of lubrication failure, increased carbon deposits, and equipment overheating damage caused by the volatilization, oxidation, thickening, or decomposition of ordinary lubricants at high temperatures. This ensures the long-term reliable operation of high-temperature equipment in metallurgy, glass, ceramics, and aero-engine industries. The upstream industry mainly includes the research and development and production of high-performance synthetic base oils (such as PAO, ester oils, and PFPE) and high-temperature additives (such as antioxidants and extreme pressure anti-wear agents); the midstream involves formulation design and blending production by specialized lubricant manufacturers; and the downstream is widely used in demanding industrial fields such as steel smelting, glass manufacturing, food processing, aero-engines, and high-temperature automotive components. In 2025, the production of high-temperature lubricating oil will be approximately 1.5 million tons, with an average price of approximately US\$3,000 per ton, a gross profit margin of approximately 30%, and a single production line capacity of 20,000 tons per year.
