High Temperature, Short Time (HTST) PasteurizationA widely used continuous process that heats food to high temperatures for a short period of time to kill harmful microorganisms while minimizing changes in the product's flavor, color, and nutritional value. This method is often referred to as flash pasteurization. HTST involves heating a food product, such as milk, to a temperature of at least 72°C (161°F) for at least 15 seconds. Unlike batch pasteurization, HTST is a continuous process, meaning that the product flows through the system continuously. HTST systems typically include plate heat exchangers for heating and cooling, holding tubes to maintain the desired temperature for a specified period of time, and pumps, valves, and piping. HTST effectively inactivates harmful bacteria, extends the shelf life of the product, and is more energy efficient than some other methods. HTST is widely used in the dairy, food, and beverage industries to pasteurize milk, dairy products, and other food and beverage products.

United States market for High-Temperature Short-Time (HTST) Pasteurization Systems is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
