The research report highlights the growth potential of the global HIGH TG PCBs market. HIGH TG PCBs are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of HIGH TG PCBs. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the HIGH TG PCBs market.

High Tg PCB is a PCB assembly with a glass transition temperature of 170°C. When the temperature rises to a certain area, most of the materials will change from the 'glass state' to the 'rubber state'. The temperature at this time is called the glass transition temperature (Tg) of the plate. That is, Tg is the maximum temperature (?) at which the base material maintains rigidity. At this time, ordinary PCB substrate materials will not only soften, deform, melt, etc. under high temperatures, but also show rapid decline in mechanical and electrical properties. Tg value, the stronger the plate's resistance to deformation, the better its dimensional stability.
