Abstracts

The global High-Thermal-Conductivity Spherical Boron Nitride Filler market size is predicted to grow from US\$ 92.93 million in 2025 to US\$ 186 million in 2032; it is expected to grow at a CAGR of 10.4% from 2026 to 2032.

High-thermal-conductivity spherical boron nitride filler is produced by agglomerating, granulating or spheroidizing hexagonal boron nitride platelets into spherical or near-spherical particles with improved flow and packing efficiency. It combines high thermal conductivity, electrical insulation, low dielectric loss and low density, enabling higher polymer loading and more continuous thermal pathways in thermal-interface, potting, engineering-plastic and high-frequency electronic materials. In 2025, global High-Thermal-Conductivity Spherical Boron Nitride Filler production reached approximately 2,100 tons.

AI servers, power electronics and dense packaging continue to increase heat flux, making thermally conductive boron nitride an important alternative or co-filler where electrical insulation is required.

Spherical agglomerates improve powder flow, reduce formulation viscosity and enable higher loading, helping polymers achieve stronger in-plane and through-plane thermal conductivity while remaining processable.

High-frequency electronics increasingly require thermal conduction, electrical insulation and low dielectric loss simultaneously, promoting high-purity BN with controlled spherical morphology and narrow particle-size distribution.
