The global High Velocity Oxygen Fuel Spraying System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The supersonic flame spraying system is a technology that uses high-speed combustion flame to spray materials, accelerates the spray particles to supersonic speed through a supersonic nozzle, and forms a coating on the sprayed surface. It combines the principles and characteristics of flame spraying and supersonic spraying. HVOF systems work by burning fuel in a burner to create a high-temperature, high-velocity flame. The sprayed material is injected into the flame, and the sprayed material is accelerated to supersonic speed by the high-temperature gas flow generated by combustion and the acceleration of the supersonic nozzle. These high-velocity spray particles form a strong coating when they interact with the surface being sprayed. The HVOF process provides highly adherent, highly dense coatings with low levels of oxidation and sintering. HVOF spraying systems are widely used in aerospace, automotive, energy and other fields to provide coatings with high temperature resistance, wear resistance, and corrosion resistance. It can be sprayed on various substrates
