## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

High voltage contactors can be divided into ceramic vacuum, ceramic inflation, and epoxy inflation according to materials. In terms of performance and stability, ceramic vacuum > ceramic inflation > epoxy inflation, while the order of cost and process difficulty is opposite. Ceramic shells have higher structural strength and better insulation and sealing properties compared to epoxy resin plastics, making them suitable for high-voltage and high current scenarios; The internal vacuum of the contactor can make the distance between the contacts very small, making it easier for the arc to extinguish when turned off, and further improving the voltage and current carrying capacity safety. New energy vehicle owners have high circuit voltage and current, and high safety requirements. Ceramic+vacuum high-voltage contactors are more suitable for their usage scenarios.

The global High Voltage Ceramic Contactor market size is projected to grow from US\$ 855 million in 2024 to US\$ 2351 million in 2030; it is expected to grow at a CAGR of 18.4% from 2024 to 2030.
