Highly conductive graphene dispersion is a type of graphene-based material that consists of graphene nanoplatelets dispersed in a liquid medium, such as water, ethanol, or other solvents. The dispersion contains a high concentration of graphene

nanoplatelets, which exhibit excellent electrical conductivity, thermal conductivity, and mechanical properties. By dispersing the graphene nanoplatelets in a liquid medium, the resulting material can be readily integrated into various applications, such as conductive coatings, printable electronics, energy storage devices, and composites, to enhance their electrical and mechanical properties. Highly conductive graphene dispersion has attracted significant attention due to its unique properties and potential for a wide range of applications.
