The HDC system monitors information such as the vehicle's speed, steering angle, and steep slope gradient through the vehicle's sensors. When drivers need to descend a steep slope, they can activate the HDC system. Once the system is activated, it automatically controls the vehicle's speed, adjusting the wheel speed through the braking system to slowly lower the vehicle. This can prevent the vehicle from sliding down the slope and improve driving safety. HDC systems typically work in conjunction with a vehicle's other systems, such as the anti-lock braking system (ABS) and traction control system (TCS), to ensure the vehicle remains stable and avoids tire spin during descents. Some vehicles are also equipped with sensors such as gyroscopes or inertial measurement units (IMUs) to further improve the accuracy and reliability of the system.

The global Hill Descent Control (HDC) market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
