A Spring Hinge is a combination of a hinge spring and a coil spring. Spring hinges are mainly used as a rotating mechanisms for doors and other devices that are to be closed automatically. If an external force is applied to change the angle, it has a function to return to the initial angle by the restoring force of the spring when the external force is released.

By utilizing the return function of hinge springs, doors can be opened and closed only by opening and closing. By using a spring hinge as an appropriate rotating mechanism, many advantages can be obtained, such as increased work efficiency, improved usability, and the prevention of forgetting to close the door.
