Hip Joint Ceramic Head and Liner refers to the primary components of a hip replacement system, consisting of a ceramic femoral head and a matching acetabular liner. The ceramic head acts as the spherical articulating surface, while the liner provides a smooth interface within the acetabular cup, together enabling low-friction and natural joint motion. These components are made from advanced ceramic materials such as alumina, zirconia, or composite ceramics, offering high hardness, excellent wear resistance, chemical stability, and biocompatibility. The combination of ceramic head and liner reduces wear debris, lowers the risk of osteolysis, and extends the prosthesis lifespan. Available in various diameters and designs, the system helps restore mobility, distribute load effectively, and maintain joint stability under repetitive physiological stresses. Proper selection of head size, liner design, and material composition is crucial to optimize joint function, minimize dislocation risk, and achieve long-term clinical outcomes. This system is particularly suited for young, active patients or those with metal allergies, providing durable and smooth articulation over time.

In 2025, global Hip Joint Ceramic Head and Liner production reached approximately 2.36 million units, with an average selling price of around USD 186 per unit.
