Hip and knee orthopedic surgical robots are advanced technology-based devices that assist orthopedic surgeons in performing total joint replacement surgeries for patients with hip or knee joint problems. The robots use computer software and advanced sensors to help the surgeons plan and execute the surgery with higher precision, accuracy, and speed than traditional methods. The robot's arm is controlled by a surgeon who can use it to make precise cuts, position the implant accurately, and adjust the positioning of the joint. The robot's software can also help the surgeon with preoperative planning and postoperative follow-up care. Hip and knee orthopedic surgical robots can help reduce surgical complications, improve patient outcomes, shorten hospital stays, and speed up recovery times. They are increasingly being used in various healthcare facilities worldwide as an advanced alternative to traditional joint replacement surgeries.
