Hirudin have strong inhibitory effect on thrombin is the strongest so far found in the natural specific inhibitor of thrombin. Animal experiments and clinical studies have shown that hirudin can be effective anticoagulant, antithrombotic, and prevent thrombin-catalyzed activation of coagulation factors and platelet reactions and blood stasis phenomenon further. In addition, it also inhibited thrombin-induced fibroblast proliferation, and thrombin stimulation of endothelial cells. Compared with heparin, which not only use less, do not cause bleeding, is not dependent on endogenous cofactor; and heparin have caused the risk of bleeding, disseminated intravascular coagulation in the pathogenesis of antithrombin III are reduced This will limit the efficacy of heparin, using leeches will have good results.
