The report requires updating with new data and is sent in 48 hours after order is placed.

Membrane nitrogen generators use membranes composed of thousands of hollow polymer fibers to achieve this separation. These fibers have a unique structure that allows only oxygen from the air and any remaining water vapor to escape through their walls. This process is called 'permeation'. Once outside the fibers, the O<sub>2</sub> is exhausted from the membrane housing and disposed of externally or in a secure area. This leaves the N<sub>2</sub> inside the hollow fibers, ready to be collected at the outlet. With the water vapor removed, the resulting nitrogen is very dry, which is an added benefit for its specialized applications.

The global Hollow Fiber Membrane Nitrogen Generator market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
