Hollow fiber membrane nitrogen and oxygen separation system is a gas separation system based on hollow fiber membrane technology, which is mainly used to achieve effective separation of nitrogen and oxygen. The hollow fiber membrane nitrogen and oxygen separation system is mainly composed of hollow fiber membrane components, pressure vessels, air inlet and outlet systems, pressure control systems and other auxiliary equipment. The hollow fiber membrane component is the core part of the system, which is composed of hundreds of thousands of hollow fiber membrane filaments, each of which is an independent separation unit. The working principle of the system is based on the permeation and molecular screening of gas molecules in the hollow fiber membrane. When the nitrogen and oxygen mixed gas passes through the hollow fiber membrane under pressure, due to the different permeation rates of oxygen and nitrogen molecules in the membrane material, the oxygen with a smaller molecular weight will pass through the membrane pores faster to the other side of the membrane, while the nitrogen with a larger molecular weight will be relatively retained in the membrane. In this way, nitrogen and oxygen gases with different oxygen concentrations can be separated on both sides of the membrane.

The global Hollow Fiber Membrane Nitrogen and Oxygen Separation System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
