## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Hollow Fiber Ultrafiltration Modules is a type of ultrafiltration membrane. It is the most mature and advanced technology in ultrafiltration technology. The hollow fiber tube wall is covered with micropores, and the pore size is expressed by the molecular weight of the substance that can be retained, and the retention molecular weight can reach thousands to hundreds of thousands. The raw water flows under pressure on the outside or inner cavity of the hollow fiber, forming external pressure type and internal pressure type respectively.

Ultrafiltration is a dynamic filtration process. The retained substances can be discharged with the concentrated water, so as not to block the membrane surface and can operate continuously for a long time. Ultrafiltration membrane is one of the earliest developed polymer separation membranes. Ultrafiltration membrane filtration can be achieved by relying on the pressure of tap water itself, without the need for electricity or pressurization. It has the characteristics of low pressure and no phase change, low energy consumption, and less wastewater discharge, which is safe and energy-saving. In addition, since ultrafiltration membrane filtration does not require electricity and pressurization, the equipment installation is simple and easy, the water production flux is large, and no supporting equipment such as water storage tanks is required. Ultrafiltration membrane filtration has the function of flushing and sewage discharge. By flushing the ultrafiltration membrane filaments forward and backward, the retained pollutants can be flushed out and the service life of the ultrafiltration membrane filaments can be extended.

The global Hollow Fiber Ultrafiltration Modules market size is projected to grow from

US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
