Holotomography microscopy is a cutting-edge imaging technique that combines holography and tomography to create three-dimensional, label-free, and quantitative images of transparent biological specimens, such as live cells. It works by capturing multiple phase-shifted holographic images of a sample illuminated from different angles and computationally reconstructing the refractive index distribution within the sample. This allows researchers to visualize and analyze intracellular structures, cell dynamics, and morphological changes in real time without the use of dyes or fluorescence. Holotomography microscopy is widely used in cell biology, drug development, and medical diagnostics for its non-invasive, high-resolution, and quantitative imaging capabilities.

United States market for Holotomography Microscopy is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Holotomography Microscopy is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
