Home neuromodulation equipment is a type of portable device designed specifically for home users. It monitors, analyzes and adjusts the user's neural activity or physiological indicators to achieve goals such as promoting mental health, improving cognitive ability, and improving sleep. These devices often use brain-computer interface technology, biofeedback technology, or neurostimulation technology to enable users to more proactively manage their neurological status.

Home neuromodulation devices analyze users' physiological data through built-in algorithms or applications and provide feedback to users about their neurological status. This can be in real time or as a subsequent data analysis report. Future devices may pay more attention to the fusion of multi-modal data, combining brain waves, physiological indicators, behavioral data and other information to provide a more comprehensive analysis of neural status. These trends reflect the continuous innovation and development in technology, user experience and application expansion in the field of home neuromodulation devices.
