The global Homobifunctional Crosslinker market size is predicted to grow from US\$ 165 million in 2025 to US\$ 264 million in 2032; it is expected to grow at a CAGR of 7.0% from 2026 to 2032.

Homobifunctional Crosslinkers are chemical reagents that contain two identical reactive functional groups capable of forming covalent bonds with the same type of functional group on biomolecules, polymers, or materials. These crosslinkers are widely used to link two molecules together, stabilize structures, or create networks in fields such as bioconjugation, protein chemistry, polymer modification, drug delivery, and materials science. Typical homobifunctional crosslinkers include reagents with NHS ester, aldehyde, maleimide, epoxide, or isocyanate groups that react with functional groups such as amines, thiols, or hydroxyls on target molecules. In the supply chain, production begins with basic petrochemical or fine-chemical feedstocks (e.g., diacids, diamines, dialdehydes, and activated ester intermediates) manufactured by specialty chemical companies; these intermediates are then converted through organic synthesis and functional group activation into crosslinker molecules by fine-chemical and biochemical reagent manufacturers. The products are subsequently purified, packaged, and distributed by life-science reagent companies and specialty chemical suppliers, and finally supplied to pharmaceutical companies, biotechnology firms, research laboratories, medical diagnostics developers, and advanced materials manufacturers for applications such as protein crosslinking, antibody conjugation, hydrogel formation, biomaterials engineering, and polymer network fabrication. In 2025, global Homobifunctional Crosslinker output was about 360 tons with 550 tons of capacity, average prices of USD 380,000 ? 650,000 per ton, and gross margins around 44%.
