The global Horizontal Electrostatic Oiler market size is predicted to grow from US\$ 137 million in 2025 to US\$ 189 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

The horizontal electrostatic oiler is a device specially designed for applying lubricating oil on the surface of metal strip materials. The horizontal electrostatic oiler is a device that uses the principle of static electricity to evenly apply lubricating oil on the surface of metal strip materials (such as steel plates, aluminum plates, etc.) in the form of mist. Its working principle is to use electrostatic adsorption to enable oil mist particles to adhere closely to the surface of metal materials, thereby achieving uniformity and high efficiency of oiling.

As a key equipment in the field of metal surface treatment, horizontal electrostatic oilers are mainly used in the anti-rust oil coating process of steel, aluminum and other plates. With the improvement of product quality and environmental protection requirements in the manufacturing industry, the penetration rate of horizontal electrostatic oilers in production lines such as cold-rolled steel plates and aluminum coils continues to increase. Especially in the fields of automobile manufacturing, home appliance industry and high-end building materials, its advantages of precise oil control and uniform coating drive demand growth. For example, China's automobile industry has an annual output of more than 25 million vehicles, and each vehicle consumes an average of about 1.2 tons of cold-rolled plates, driving the market demand for oilers.
