The horizontal gantry cladding machine is an advanced metal surface treatment technology equipment, mainly used for cladding treatment on the surface of metal substrates. It adopts a gantry structure design, has a large working space and flexibility, and is suitable for cladding processing of large workpieces or complex-shaped workpieces.

The working principle of the horizontal gantry cladding machine is to heat the cladding material to a molten state through high-temperature heat sources (such as lasers, electron beams, flames, etc.), spray or smear it on the surface of the substrate, and then apply it under specific process conditions. Cooling and solidification occur, forming a new layer of material with specific properties on the surface of the substrate.

This technology is widely used in machinery manufacturing, aerospace, automobile manufacturing, energy and other fields to repair wear, enhance surface properties, improve material properties and other purposes. The horizontal gantry cladding machine has the advantages of high cladding efficiency, good cladding quality, and easy operation. It is one of the important equipment in modern metal surface treatment technology.

The global Horizontal Gantry Cladding Machine market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
