The research report highlights the growth potential of the global Horizontal PECVD market. Horizontal PECVD are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Horizontal PECVD. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Horizontal PECVD market.

PECVD is a method or equipment known for its low-temperature deposition of thin films. The process temperature usually only needs to be in the lower temperature range of 200 to 400°C. Its basic principle is to use microwaves or radio frequencies to ionize the gas containing the atoms that make up the film to form a highly chemically active plasma, thereby depositing the desired film on the substrate. Among various types of PECVD equipment, tubular PECVD is widely used in the crystalline silicon cell industry. This equipment uses a quartz tube as the deposition chamber and a resistance furnace as the heating body. A graphite boat that can hold multiple silicon wafers is inserted into the quartz tube for thin film deposition.

The major global tubular PECVD companies include Applied Materials, ASM International, Lam Research, Wonik IPS, Meyer Burger, Centrotherm, Tempres, Plasma-Therm, S.C New Energy Technology and Jusung Engineering. Among them,

the market share of the Top 5 companies has reached 80%, and the market height Concentration, high-end PECVD equipment is mainly monopolized by American and European companies.
