A horizontally mounted propeller pump is a type of axial flow pump that is designed to move large volumes of fluid at low to medium heads. It is characterized by its horizontally oriented shaft and propeller, which are mounted within a casing. The pump consists of several key components, including the casing, propeller, shaft, and motor. The casing encloses the propeller and creates a flow path for the fluid. The propeller, attached to the shaft, rotates horizontally, drawing in fluid axially and then propelling it in the same axial direction.

The horizontally mounted propeller pump is a reliable and efficient solution for moving large volumes of fluid at low to medium heads. Its axial flow design, coupled with a horizontal orientation, makes it suitable for various water management and fluid circulation applications.
