Hot bending refers to the process of heating and pressurizing a 2D glass cover plate into a 3D curved glass cover plate through a hot bending machine, and the carrier is a graphite mold. The whole process of hot bending is to place the glass with the carved shape and holes in the graphite mold, and then put the mold into the hot bending machine. After preheating, pressing and cooling, the glass is formed into curved glass in the mold. The performance of the hot bending machine has a crucial impact on the forming. The most important thing is that the temperature of the glass in the furnace body should be uniform during the forming process, so that the glass can be heated evenly to avoid stress embrittlement.
