The hot core box method is to make core sand made of liquid thermal resin binder and catalyst. It is filled into a metal core box heated to 180 °-250 °, so that the sand core close to the surface of the core box is heated. It can be polycondensed and hardened in a short time, and as long as the surface layer of the sand core has a millimeter to form a hard shell, it can be taken out from the core box. The sand core in the center part can be hardened by itself using the waste heat and the heat released by the hardening reaction. It is fast The production of medium and small sand cores with high dimensional accuracy (the maximum wall thickness of sand cores is generally 50-75mm) provides a very effective method, especially suitable for the production of castings in automobiles, tractors or similar industries
