The global Hot-coated Fluorine Release Film market size is predicted to grow from US\$ 343 million in 2025 to US\$ 446 million in 2032; it is expected to grow at a CAGR of 3.9% from 2026 to 2032.

Thermal bonding type fluorine release film refers to a fluorine release film that uses thermal bonding during the bonding process. The fluorine release film itself is a film made of PET (polyethylene terephthalate) as the base material and a fluoride release agent is coated on its surface. Thermal bonding is a specific method in its application process. When thermal bonding type fluorine release film is bonded, it is usually directly bonded to the fluorine release film when there is still residual temperature after PET or PI (polyimide) is coated with silicone, without entering the oven for high-temperature curing. This process simplifies the production process and improves production efficiency. Thermal bonding type fluorine release film has excellent physical and mechanical properties, such as small thickness tolerance, high transparency, good flexibility, etc., which enables it to maintain stable performance in various application scenarios.

Thermal bonding type fluorine release film is widely used in various occasions that require anti-sticking protection, especially in the bonding process of industrial products such as PI, green high-temperature tape production, silicone double-sided tape die-cutting and punching, and thermal conductive silicone casting. In addition, it can also be used for bonding materials such as gold fingers, green glue, AB glue, 3M silicone, and die-cut into any other shape for some special purposes.
