The global Hot Evaporative Humidifier market size is predicted to grow from US$ 3124 million in 2025 to US$ 5518 million in 2032; it is expected to grow at a CAGR of 8.6% from 2026 to 2032.

The working principle of a thermal evaporative humidifier is to heat water to 100 degrees in a heating body, evaporate it to produce steam, and then use a fan to send the steam out, thereby increasing the humidity of the air. This process is similar to the principle of converting electrical energy into thermal energy, the water temperature continues to rise, and when it reaches a certain level, water vapor is produced. A thermal evaporative humidifier is a type of humidifier, which can be further subdivided into electrode humidifiers, electric heating humidifiers, and dry steam humidifiers. These humidifiers may differ slightly in structure, but the core working principle is to use heat energy to evaporate water into water vapor and then release it into the air. Thermal evaporative humidifiers are generally suitable for places where humidity needs to be precisely controlled, such as laboratories, hospitals, libraries, etc. At the same time, because its humidification effect is stable and does not produce pollutants such as white powder, it is also suitable for families with high requirements for air quality.

United States market for Hot Evaporative Humidifier is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Hot Evaporative Humidifier is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
