In order to achieve efficient fuel combustion, the quality of injected fuel must be perfectly matched with the air supply in the engine cylinder. In addition, the hot film mass air flow sensor with digital technology is used to measure the air quality in the combustion chamber. The hot-film air quality meter can be provided with all functional models as a plug-in sensor or as a plug-in sensor in the cylinder housing. The cylinder housing can be customized to meet any diameter, length or connection requirements. The air management system ensures that the correct amount of air is supplied to the

engine under various operating conditions. Here, the electronic control unit receives the latest and accurate information about the intake air quality and other characteristics. The hot film air mass meter for air control provides this information. The hot film air mass meter calculates the accurate air mass flowing into the air inlet by measuring the temperature difference between two defined temperature fields. As the air flow through the sensor increases, the temperature difference will also change. The integrated electronic module calculates the air quality according to the temperature difference and sends the signal to the ECU.
