Hot-Rolled Wire Rod for Prestressed Steel Wire and Strands is a specialized high-carbon hot-rolled wire rod designed for subsequent drawing, stranding, and stabilization treatments to produce high-strength prestressing steel materials such as prestressing steel wire and prestressed concrete (PC) strands. This product places a strong emphasis on high strength, cleanliness, structural uniformity, drawability, and fatigue performance; it typically utilizes high-carbon steel or micro-alloyed high-carbon steel systems, and its ultimate application lies in the reinforcement of prestressed concrete structures.

The upstream supply chain primarily comprises iron ore, coke, scrap steel, alloying agents, ferrosilicon-manganese, ferrochrome, ferrovanadium, aluminum deoxidizers, protective slag, and refractory materials. Among these inputs, achieving high-purity molten steel, stable carbon and manganese compositions, and strict control over low phosphorus, sulfur, and inclusion levels are critical factors that determine the wire rod's drawability and the finished product's fatigue life. Downstream, following processes such as pickling, phosphating (or other surface treatments), drawing, stranding, and stabilization, the material is transformed into prestressing steel wire and PC strands, which are then incorporated into prestressed concrete structures across sectors including bridges, railways, construction, water conservancy, municipal infrastructure, and energy engineering.

In 2025, global sales volume is projected to reach approximately 6.3 million tons, with

an average selling price of around \$680 per ton; the gross profit margins for major manufacturers within the industry are expected to range between 10% and 20%.
