The global Hot Runner Nozzles market size is predicted to grow from US\$ 310 million in 2025 to US\$ 431 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

In 2025, global hot runner nozzle production reached approximately 1623 k units, the average price is 195 usd/unit. The hot runner nozzle is the end-effector of the hot runner system. It is installed between the manifold and the mold cavity and its main function is to inject molten plastic directly and precisely into the mold cavity from the manifold.

Market Concentration and Major Players:

Internationally, the hot runner nozzle market is highly concentrated, primarily in developed countries like Europe and America. Large manufacturers include HASCO and G?NTHER. Domestically, however, there is still significant room for growth in the hot runner nozzle market.

Manufacturing Process and Market Trends: Hot runner nozzles are typically manufactured using high-temperature resistant and wear-resistant special alloy steel or titanium-zirconium-molybdenum alloys. After forging and annealing to relieve stress, complex internal flow channels are formed using five-axis CNC milling and EDM. Precision grinding ensures the flatness and sealing of the assembly surfaces. Finally, heating coils and sensors are integrated, and hard chrome plating or PVD coating is applied to improve surface properties.

The market trend is primarily towards smaller sizes to meet the high-volume, multi-cavity mold requirements of small products such as electronic medical devices. These nozzles also feature more intelligent real-time temperature control and pressure monitoring capabilities, and are continuously adapting to the molding requirements of

new engineering plastics such as long glass fiber reinforced and biodegradable materials. Their application in high-value-added fields such as automotive, electronics, and medical devices is also deepening.
