The global Hotspot Detection System market size is predicted to grow from US$ 1480 million in 2025 to US$ 2307 million in 2031; it is expected to grow at a CAGR of 7.7% from 2025 to 2031.

A Hotspot Detection System is a technology that is used to identify and locate areas of high temperature or heat concentration. It is commonly used in various industries such as fire detection, thermal imaging, and industrial processes.

The system typically consists of sensors or cameras that are capable of detecting infrared radiation emitted by objects or surfaces. These sensors can measure the temperature of an object or area and identify any abnormal or excessive heat signatures.

Hotspot Detection Systems are often used in fire detection and prevention. They can identify potential fire hazards or overheating equipment by detecting hotspots or areas with high temperatures. This early detection allows for prompt action to be taken to prevent fires or mitigate their impact.

In thermal imaging, Hotspot Detection Systems are used to identify areas of heat loss or energy inefficiency in buildings. By detecting hotspots, these systems can help identify insulation issues, air leaks, or faulty equipment, allowing for energy-saving measures to be implemented.

In industrial processes, Hotspot Detection Systems can be used to monitor and control
