Household high-temperature steam mops are household appliances that use electricity to heat water to generate high-temperature steam (usually exceeding 100°C), and then use the steam jets to clean floors with a cloth. Their core function is to effectively dissolve grease and kill most bacteria and mites using only high-temperature steam, eliminating the need for chemical cleaners. This achieves highly efficient and environmentally friendly physical cleaning, making them particularly suitable for hard surfaces such as tiles and hardwood floors. The upstream mainly consists of raw material and component suppliers, including manufacturers of core components such as heating boilers, motors, and plastic casings. The downstream reaches consumers through online and offline retail channels, providing cleaning accessories and after-sales service, forming a complete industrial chain. In 2024, the global household high-temperature steam mop market had an average price of $45 per unit, with sales of approximately 47.3 million units and a global production capacity of 50-60 million units, resulting in an industry profit margin of 20-30%.
