The household low-temperature variable frequency heating machine is a heat pump device that uses variable frequency compression technology and is suitable for heating homes or small independent spaces. It can operate stably in extremely cold environments as low as -25°C. The device absorbs low-grade heat energy from the air to achieve efficient heating. It has the characteristics of energy saving, environmental protection, precise temperature control, and low operating noise. It is an important green heating solution to replace traditional coal-fired and gas-fired heating equipment. It is widely used in northern heating, rural 'coal to electricity' and household heating.
