Steels with yield strengths higher than 550 MPa are considered AHSS, and when the tensile levels exceed 780 MPa, they are referred to as UHSS. The key difference between UHSS and AHSS is in their microstructures. The microstructures of AHSS can be engineered to produce unique mechanical properties; some have a higher strain hardening capacity, which gives them a superior strength/ductility balance, while others have higher yield and tensile strengths and demonstrate bake-hardening behavior.
